

**ABSTRACT**

The present invention provides a granulated product having improved granulatability which contains a compound with poor wettability and a surfactant, particularly the granulated product  
5 wherein at least about 35% by weight with respect to the total weight of the product does not pass through a 100-mesh sieve, and a method for preparing the granulated product having improved granulatability containing a compound with poor wettability, which comprises adding a surfactant to the compound before or  
10 during the granulation, particularly at a weight ratio of about 0.001 to about 2.
